□□□□□□□□□

Your HRM software supplier was compromised and distributed a backdoored version. You may already have upgraded. Indicators of compromise are published.

Defensomania

□□□□□□□□□

Your national CERT has published indicators of compromise for your country and your industrial sector. Report back if you find any hits.

Defensomania

□□□□□□□□□

Several employee accounts were abused for further attacks against your customers. Initial analysis shows that all of them visited a typosquatted domain of your corporate portal.

Defensomania

□□□□□□□□□

An employee's workstation was infected with a banking Trojan that changed network settings and installed email monitoring software. It is linked to a recent malvertising campaign.

Defensomania

□□□□□□□□□

One of your ticketing systems is compromised and malware was placed on it. The malware connects to other systems reachable from that server.

Defensomania

□□□□□□□□□

Spear phishing attack against an employee, who reports logging into a look-alike company portal.

Defensomania

□□□□□□□□□

Spear phishing attack against an employee using a malicious document that executed code on the computer when opened.

Defensomania

□□□□□□□□□

An employee downloads malware disguised as a software package. It connects back to command and control servers using DNS.

Defensomania

□□□□□□□□□

A vulnerability on one of your servers was exploited and an attacker accessed the customer database. Increased bandwidth was registered on the network device.

Defensomania

□□□□□□□□□

A database with customer data was exposed to the Internet through a misconfigured firewall and someone on Twitter is leaking data from that database.

Defensomania

□□□□□□□□□

A public git repository leaked internal credentials and it's unclear whether they were already abused.

Defensomania

□□□□□□□□□

Servers of your main online service were targeted by a DDoS attack and are unavailable.

Defensomania

□□□□□□□□□

Malicious code was distributed to your endpoints during a routine update of a signed application.

Defensomania

□□□□□□□□□

A domain admin ran a malicious attachment after loudly proclaiming how dumb their users are for doing the same.

Defensomania

□□□□□□□□□

A security company has released an APT group PDF at BH USA. The list of IOCs includes a host in your ASN.

Defensomania

□□□□□□□□□

Every night, new corporate accounts are abused for sending spam.

Defensomania

□□□□□□□□□

Your email infrastructure was compromised. Attackers have full access to your mailboxes.

Defensomania

□□□□□□□□□

Attackers gained domain admin in your environment. Backdoor accounts were created and disk encryption software was activated.

Defensomania

□□□□□□□□□

# An adversary has access to your Jenkins server.

Defensomania

□□□□□□□□□

An adversary has access to your vulnerable Jenkins server. Jenkins jobs with credentials are visible to everyone.

Defensomania

□□□□□□□□□

Someone is impersonating you to customer support at one of your service providers.

Defensomania

□□□□□□□□□

# Your DNS was modified to respond with an attacker's DKIM key.

Defensomania

□□□□□□□□□

Due to a botched CI/CD script, the complete source code is exposed on production.

Defensomania

□□□□□□□□□

# A bug in your web app allowed every record to be accessed via URL enumeration and IDOR.

Defensomania

□□□□□□□□□

Your subscription database was hacked. Thousands of new accounts were added and are hard to distinguish from existing ones.

Defensomania

□□□□□□□□□

A new paste on a public paste site contains password hashes and emails from your customer database from three years ago. More recent hashes are missing.

Defensomania

□□□□□□□□□

Your reception software leaked all of your visitor logs. They are available via torrent.

Defensomania

□□□□□□□□□

A script has been logging exported variables containing full user registration objects. The logs are full of plaintext passwords.

Defensomania

□□□□□□□□□

After a user's password reset, mailbox reads continue under an unfamiliar OAuth grant. A legitimate integration has the same scope. Business email must stay available.

Defensomania

□□□□□□□□□

A ransomware alert is followed by a gap in endpoint telemetry. The host appears online, backups have not yet been tested, and operations requests an immediate restart.

Defensomania

□□□□□□□□□

Joker - be evil and invent a new nightmare scenario that gets your team struggling. (If you want to go crazy, contribute your scary scenario for the sake of humanity.)

Defensomania

□□□□□□□□□

Joker - be evil and invent a new nightmare scenario that gets your team struggling. (If you want to go crazy, contribute your scary scenario for the sake of humanity.)

Defensomania

□□□□□□□□□

Joker - be evil and invent a new nightmare scenario that gets your team struggling. (If you want to go crazy, contribute your scary scenario for the sake of humanity.)

Defensomania

□□□□□□□□□

A developer just mistyped an upstream package name while installing it on their laptop. A malicious package was waiting for that typo and its post-install code is exfiltrating data.

Defensomania

□□□□□□□□□

An engineer mistyped a package name in a product repository. The package is malicious and exfiltrates CI/CD and production environment variables to a C&C server.

Defensomania

□□□□□□□□□

A malicious browser extension was installed on several corporate computers. It injects keyloggers into websites.

Defensomania

□□□□□□□□□

Your software build imports an employee's personal NPM package. The employee quits and vandalizes the package, causing a public incident.

Defensomania

An adversary takes control of your MDM service account. Your MDM support team cannot be reached for account recovery.

□□□□□□□□□

Your DNS was modified to respond with an attacker's DKIM key. Spear phishing emails will be signed by your domain in 30 minutes.

Defensomania

□□□□□□□□□

The certificates of your primary code signing process were compromised and used to sign malicious apps.

Defensomania

□□□□□□□□□

An employee left a firewall rule wide open after several hours of troubleshooting a network issue.

Defensomania

□□□□□□□□□

An employee left a firewall rule wide open after a faulty change request was implemented. Brute-force attempts were registered on previously protected servers.

Defensomania

□□□□□□□□□

You allow customers to upload sensitive information to your platform to share with others. However, the data was left unprotected and anyone could access and download it.

Defensomania

□□□□□□□□□

You were informed that one of your website directories used to share files with external parties was accessible and writable by any anonymous user. Suspicious files were found.

Defensomania

□□□□□□□□□

You were informed that your MDM solution was compromised and over 75% of your employees' mobile devices are infected with malware.

Defensomania

□□□□□□□□□

You were informed that your firewalls were compromised and malware was executed on these devices to steal information.
